Process diagram of Stage House - removing a portion of the earthwork, reshaping and then rotating to return it to the earth.

DWELLING #2 STAGE HOUSE

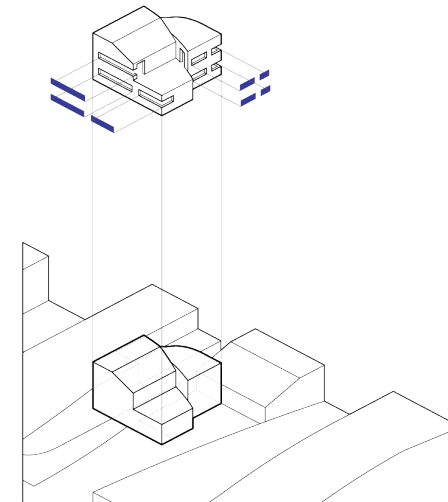

PRINTER DIMENSIONS: 36W X 48W X 34H

This is a two story dwelling that focuses on vertical circulation. This dwelling will be printed in a single print vertically, and the printer will not be repositioned during construction.

The gap between the Earthwork and the curved portion of the house is transformed into an outdoor bathing space - an allusion to water accumulating in sinkholes created after fire burns subterranean objects.

This dwelling is born of the earthwork, and subsequently split by the circular geometry that runs through the site. Push and pull forces shape the form as how tectonic plates slide against each other. Both the curved roof and sloped roof are inhabitable.

This dwelling in the present moment is designed as a duplex for a traditional family with younger children, and a young adult who may be an older child.

Render of outdoor bathroom/void space.
